

Dr. Lee-Anne Huber, University of Guelph

Dr. Lee-Anne Huber was raised on a mixed farm of beef cattle and pigs just north of Guelph, ON. She decided to attend the University of Guelph with the intention of becoming a large animal veterinarian but soon discovered the world of swine nutrition research instead. After her BSc, she continued with a MSc and PhD, also at the University of Guelph, and a post-doctoral fellowship at Memorial University of Newfoundland. Lee-Anne is now the swine nutrition researcher at the

University of Guelph and her research program focuses on improving the sustainability of pork production using nutrition as a tool. Currently, she is examining low-environmental impact feed ingredients, identifying means to improve the value of feed ingredients, and using precision agriculture to better predict and meet the nutrient requirements of lactating and gestating sows. Lee-Anne still enjoys helping on her family's farm (anything from shoveling manure to combining) and spending time with family and friends.
